

Fig S3. LRSE and analysis of decreased susceptibility to glycopeptides A. Heat map of the distribution of AAS in proteins associated with decreased susceptibility to glycopeptides in *S. epidermidis*. Distribution into four groups - all LRSEs, all LSSEs, BAPS2 and BAPS3 genomes. The names contain the names of the protein, the position with the substitution. Mutations that are associated with the only LRSE group are marked in red. B - Results of MCA analysis. Clusters associated with LRSE or LSSE was not found. C - Distribution of isolates with PAP data, genotypes, and variants of mutations in RpoB. There was no direct relationship between rifampicin resistance and the results of PAP analysis.
